Introduction

Introducing the Microtrader Application

- Local development environment
- Microservices architecture
- Installing the application
- Building the application
- Running the application
- Testing the application

Application Architecture

Trader Dashboard

Quote Generator

Audit Service

Traders

Portfolio

Portfolio Service

Stock Quotes

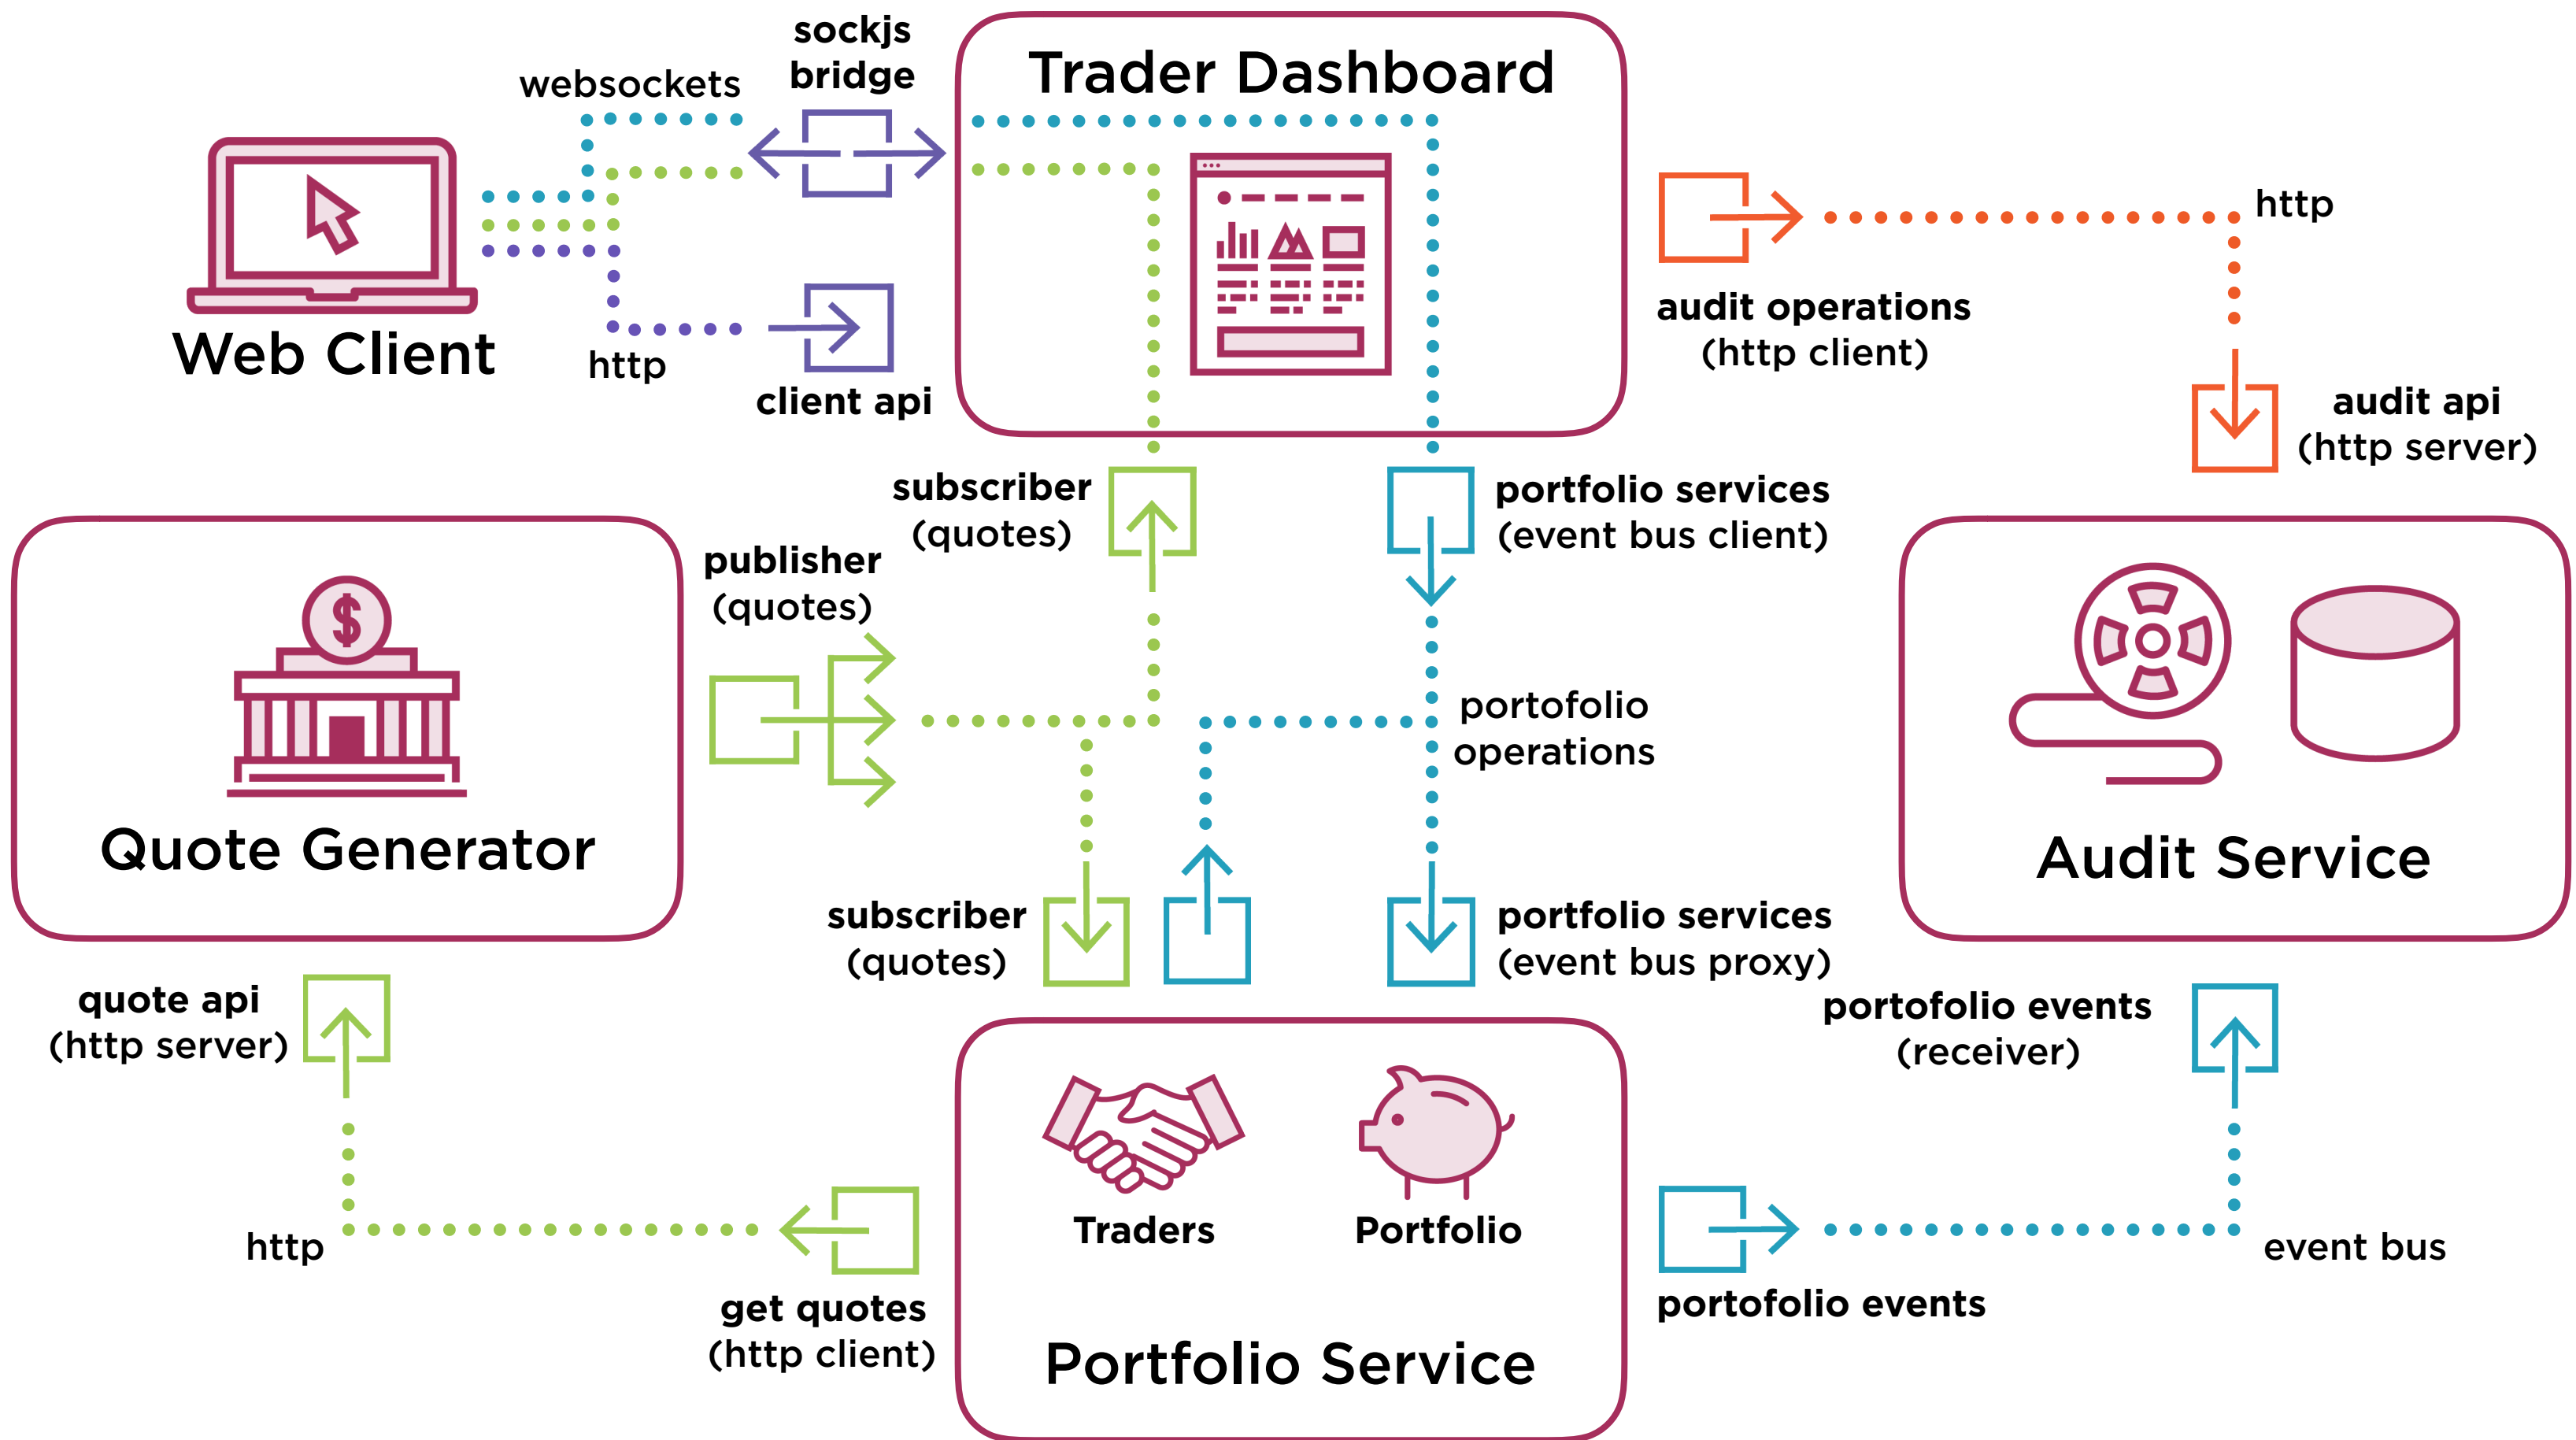

MacroHard

Divinator

Black Coat

Demo

Application Walkthrough

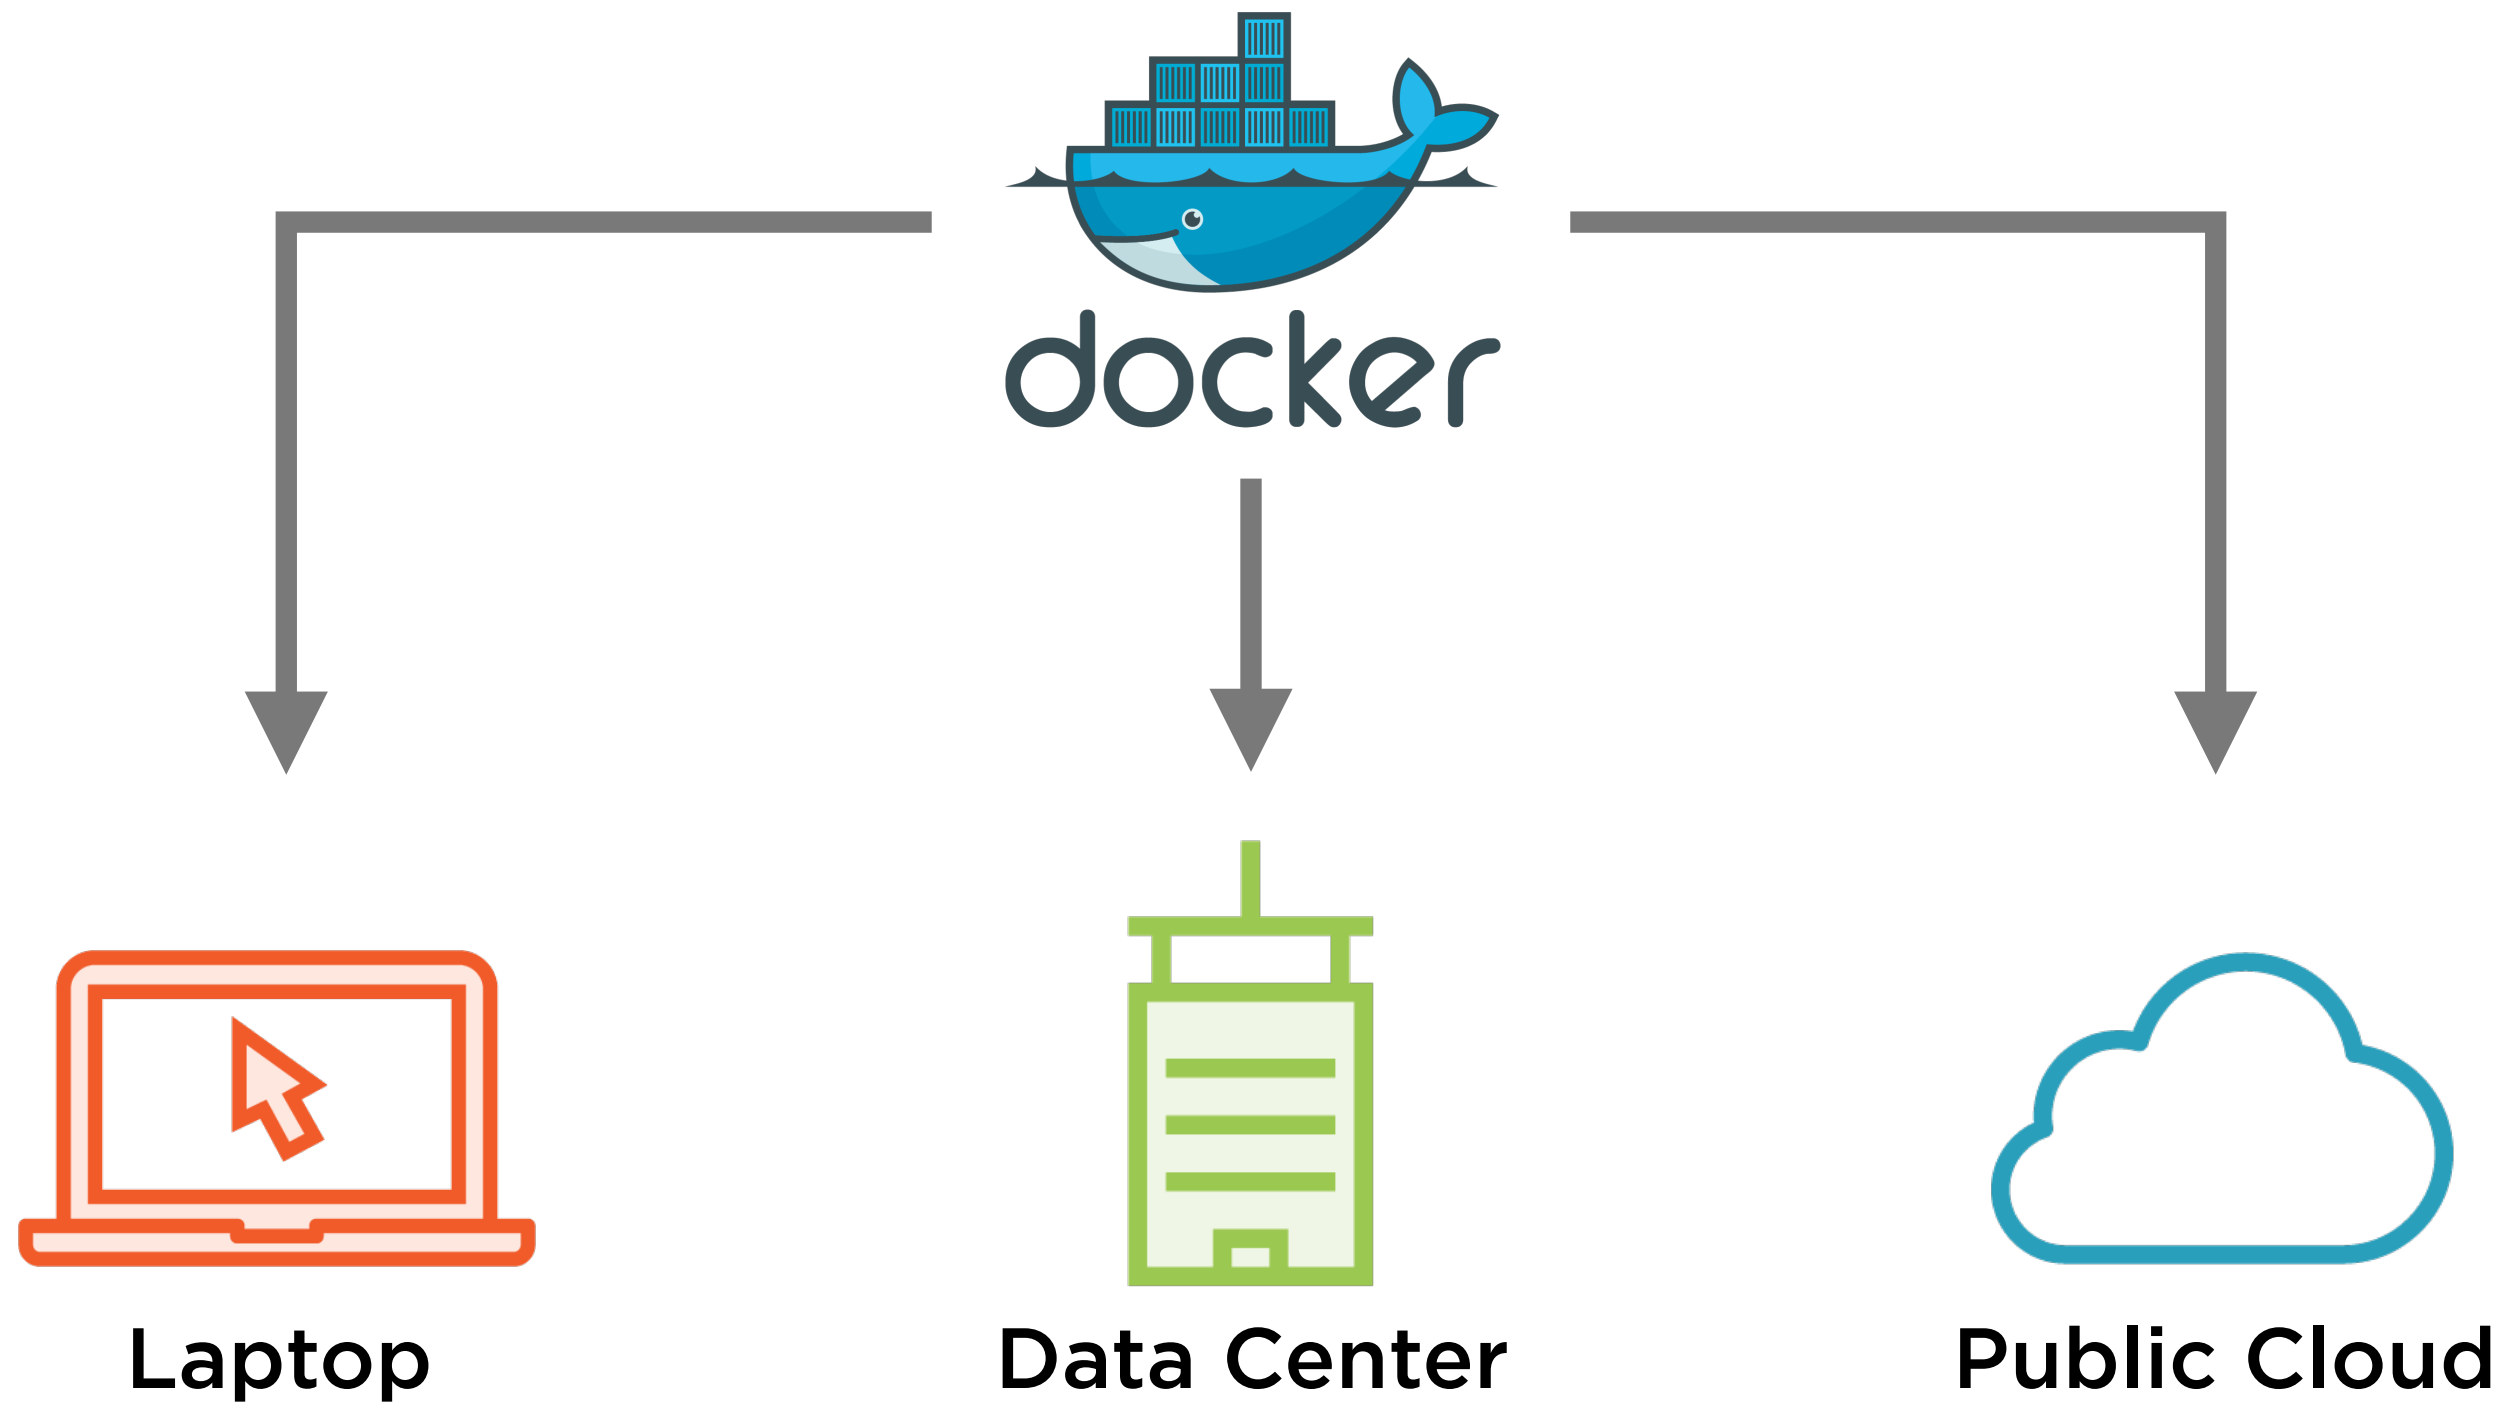

- Installing the application
- Building the application
- Running the application
- Testing the application

Installing the Application

Building the Application

“But it worked on my machine!”

Docker works on any machine...

Fat JAR

Application Source

Dependencies

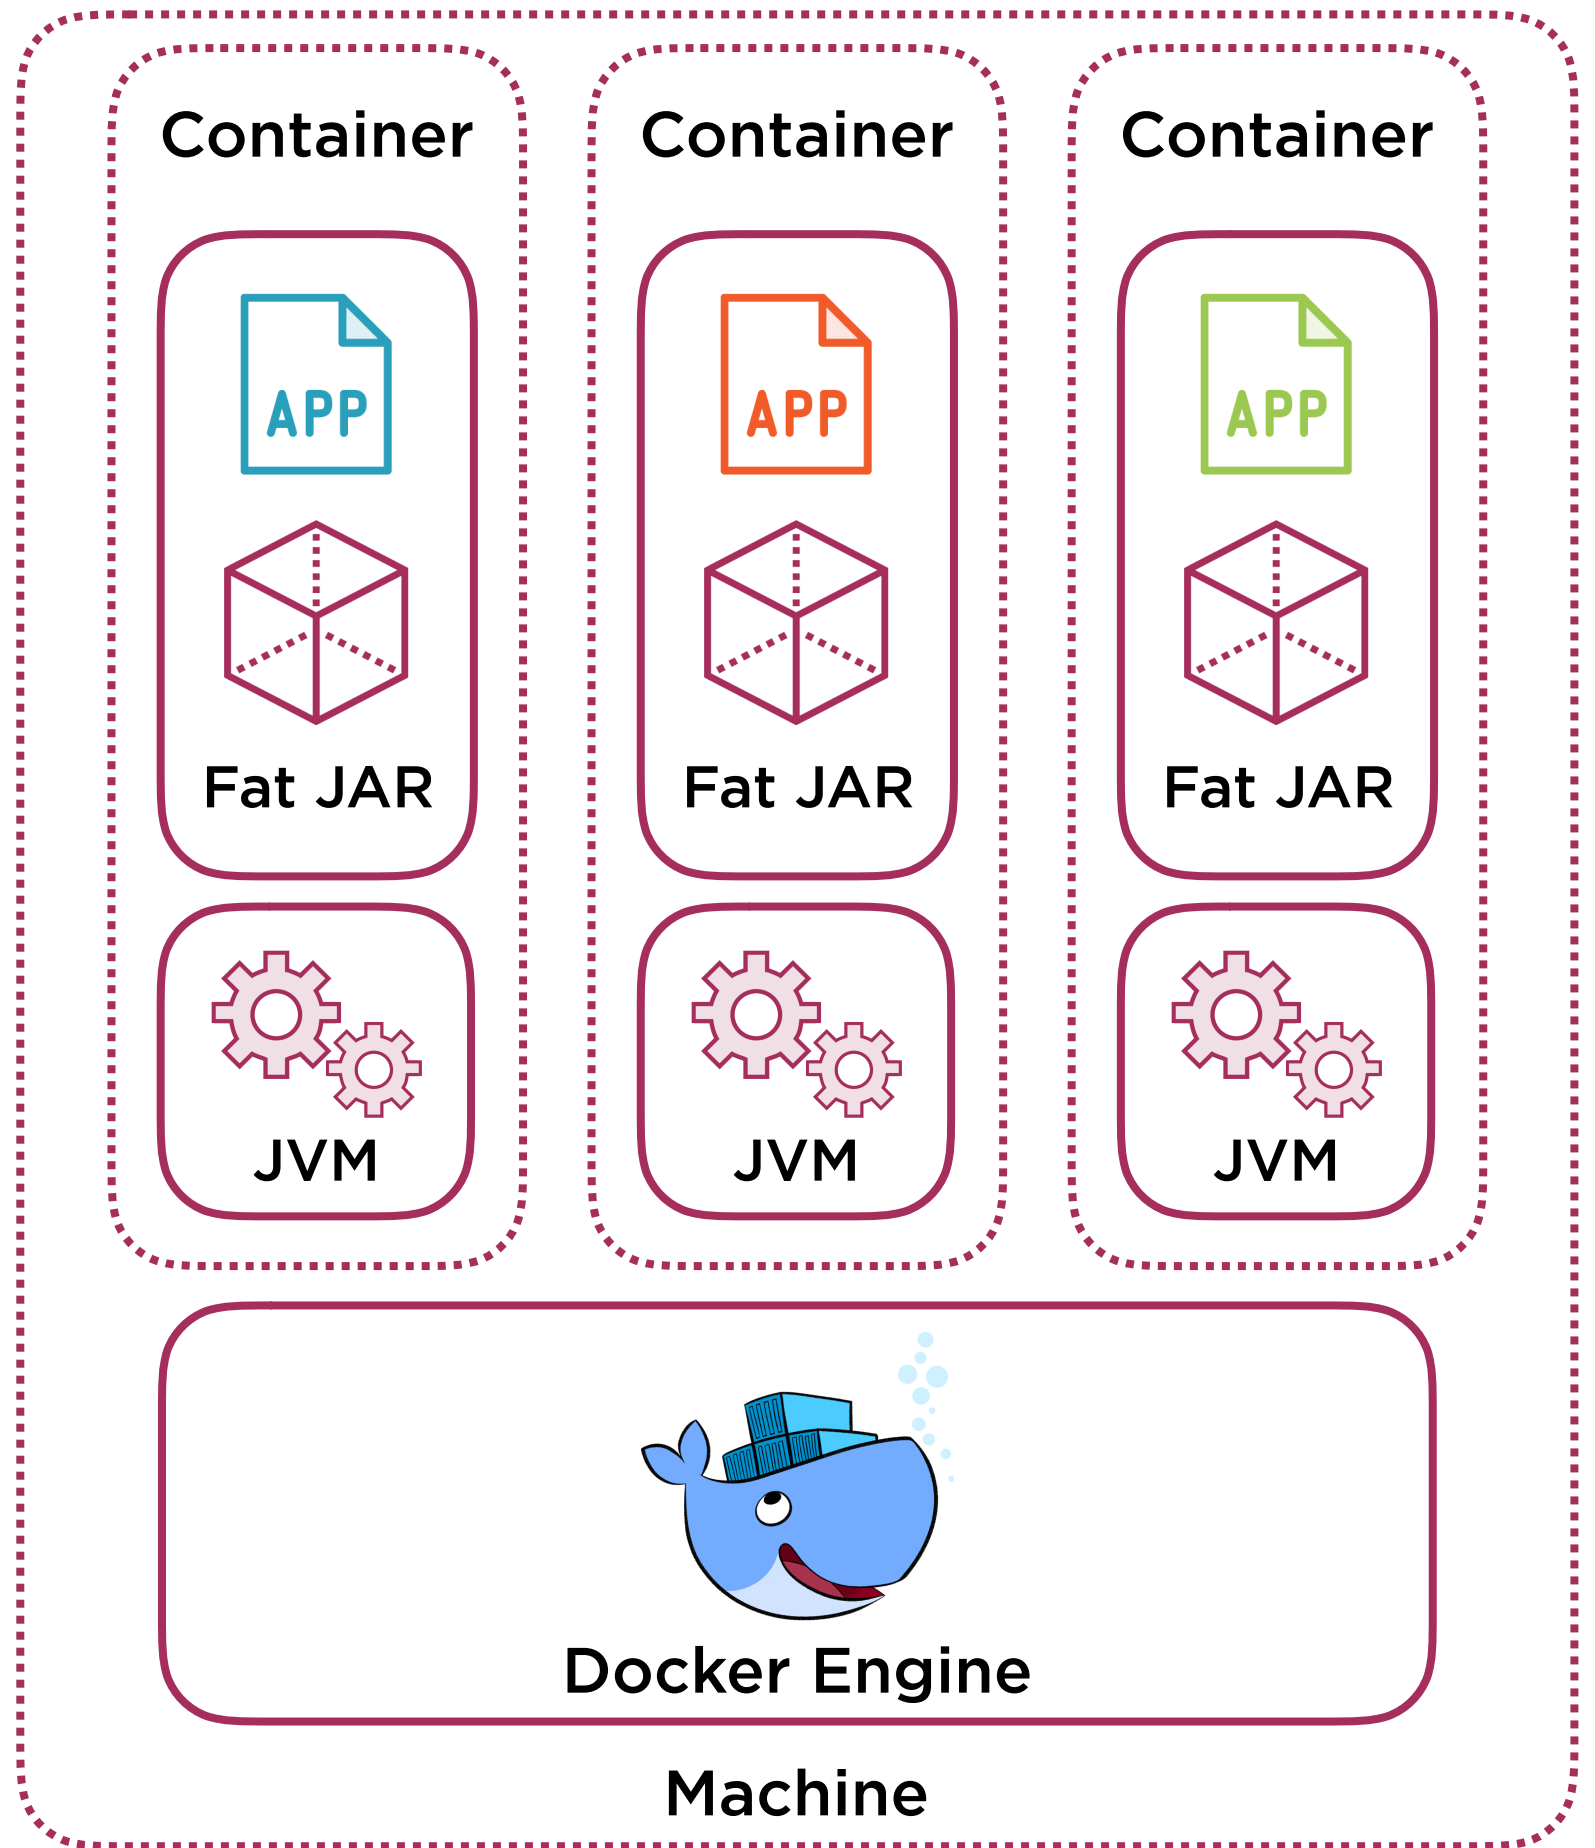

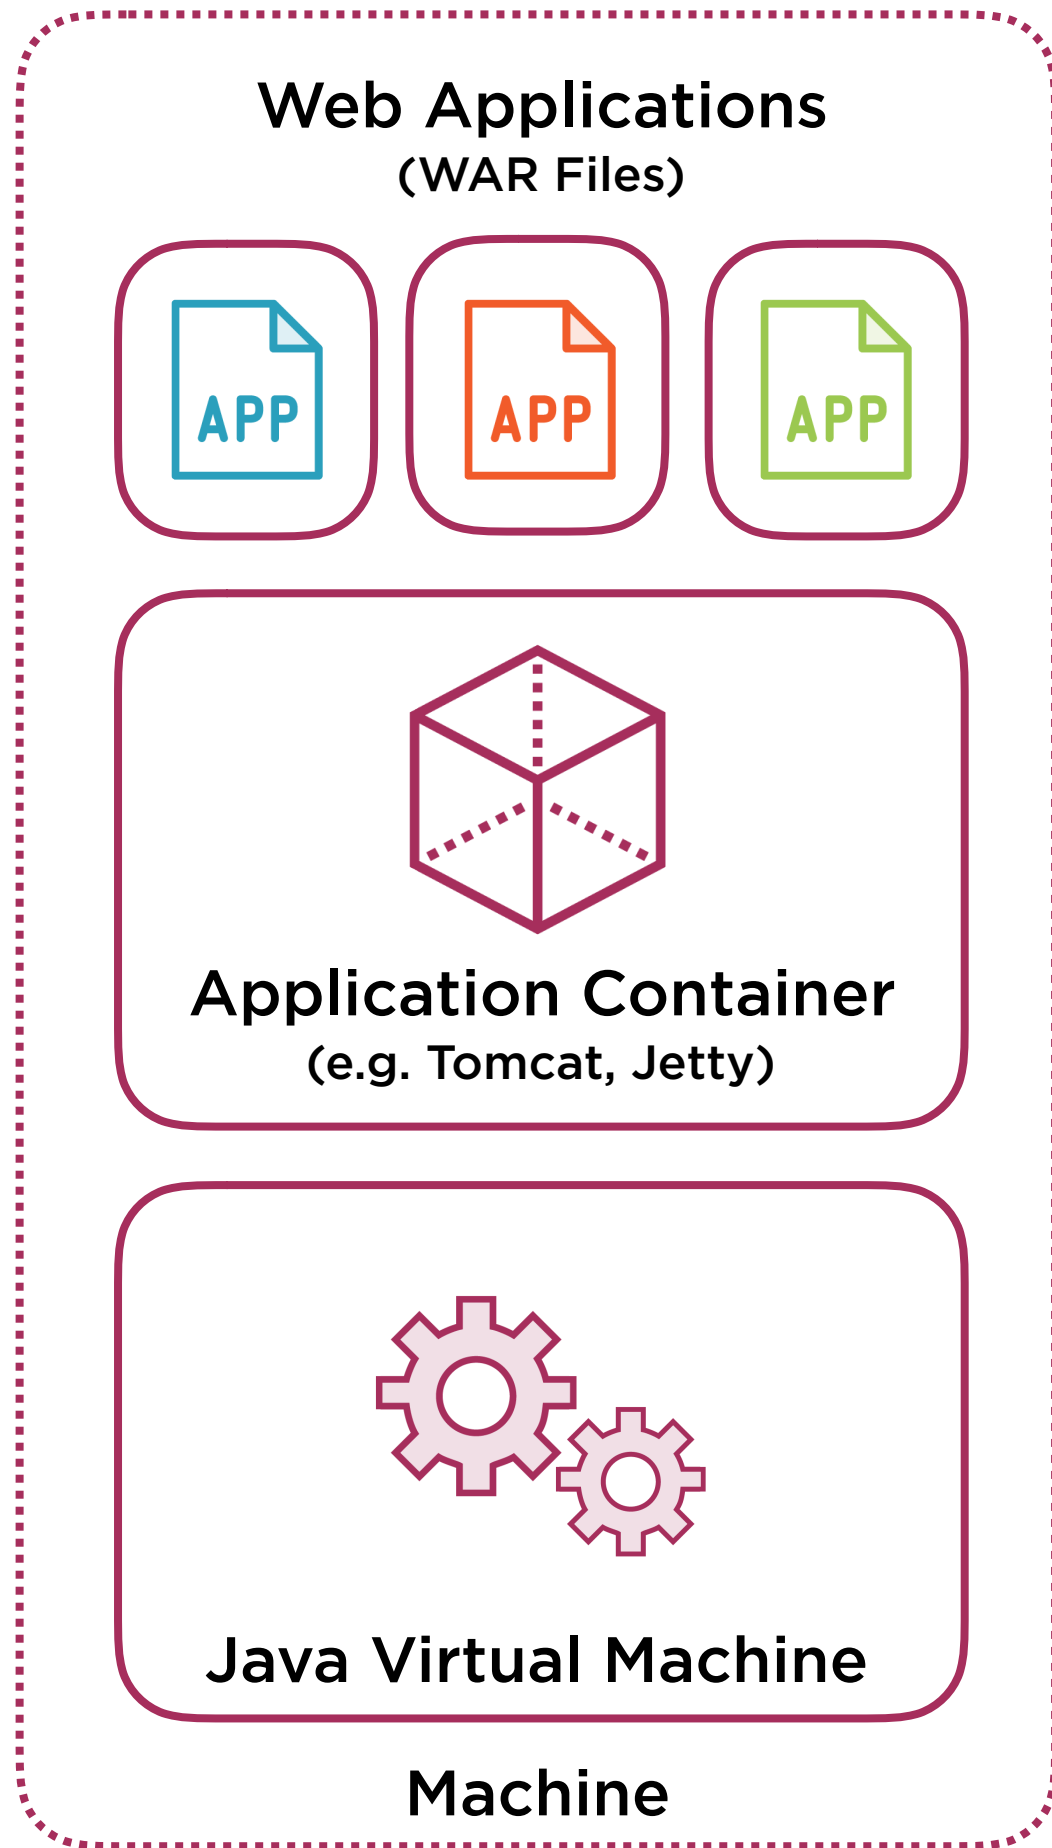

Application Container
(e.g. Jetty)

Packages application and all dependencies

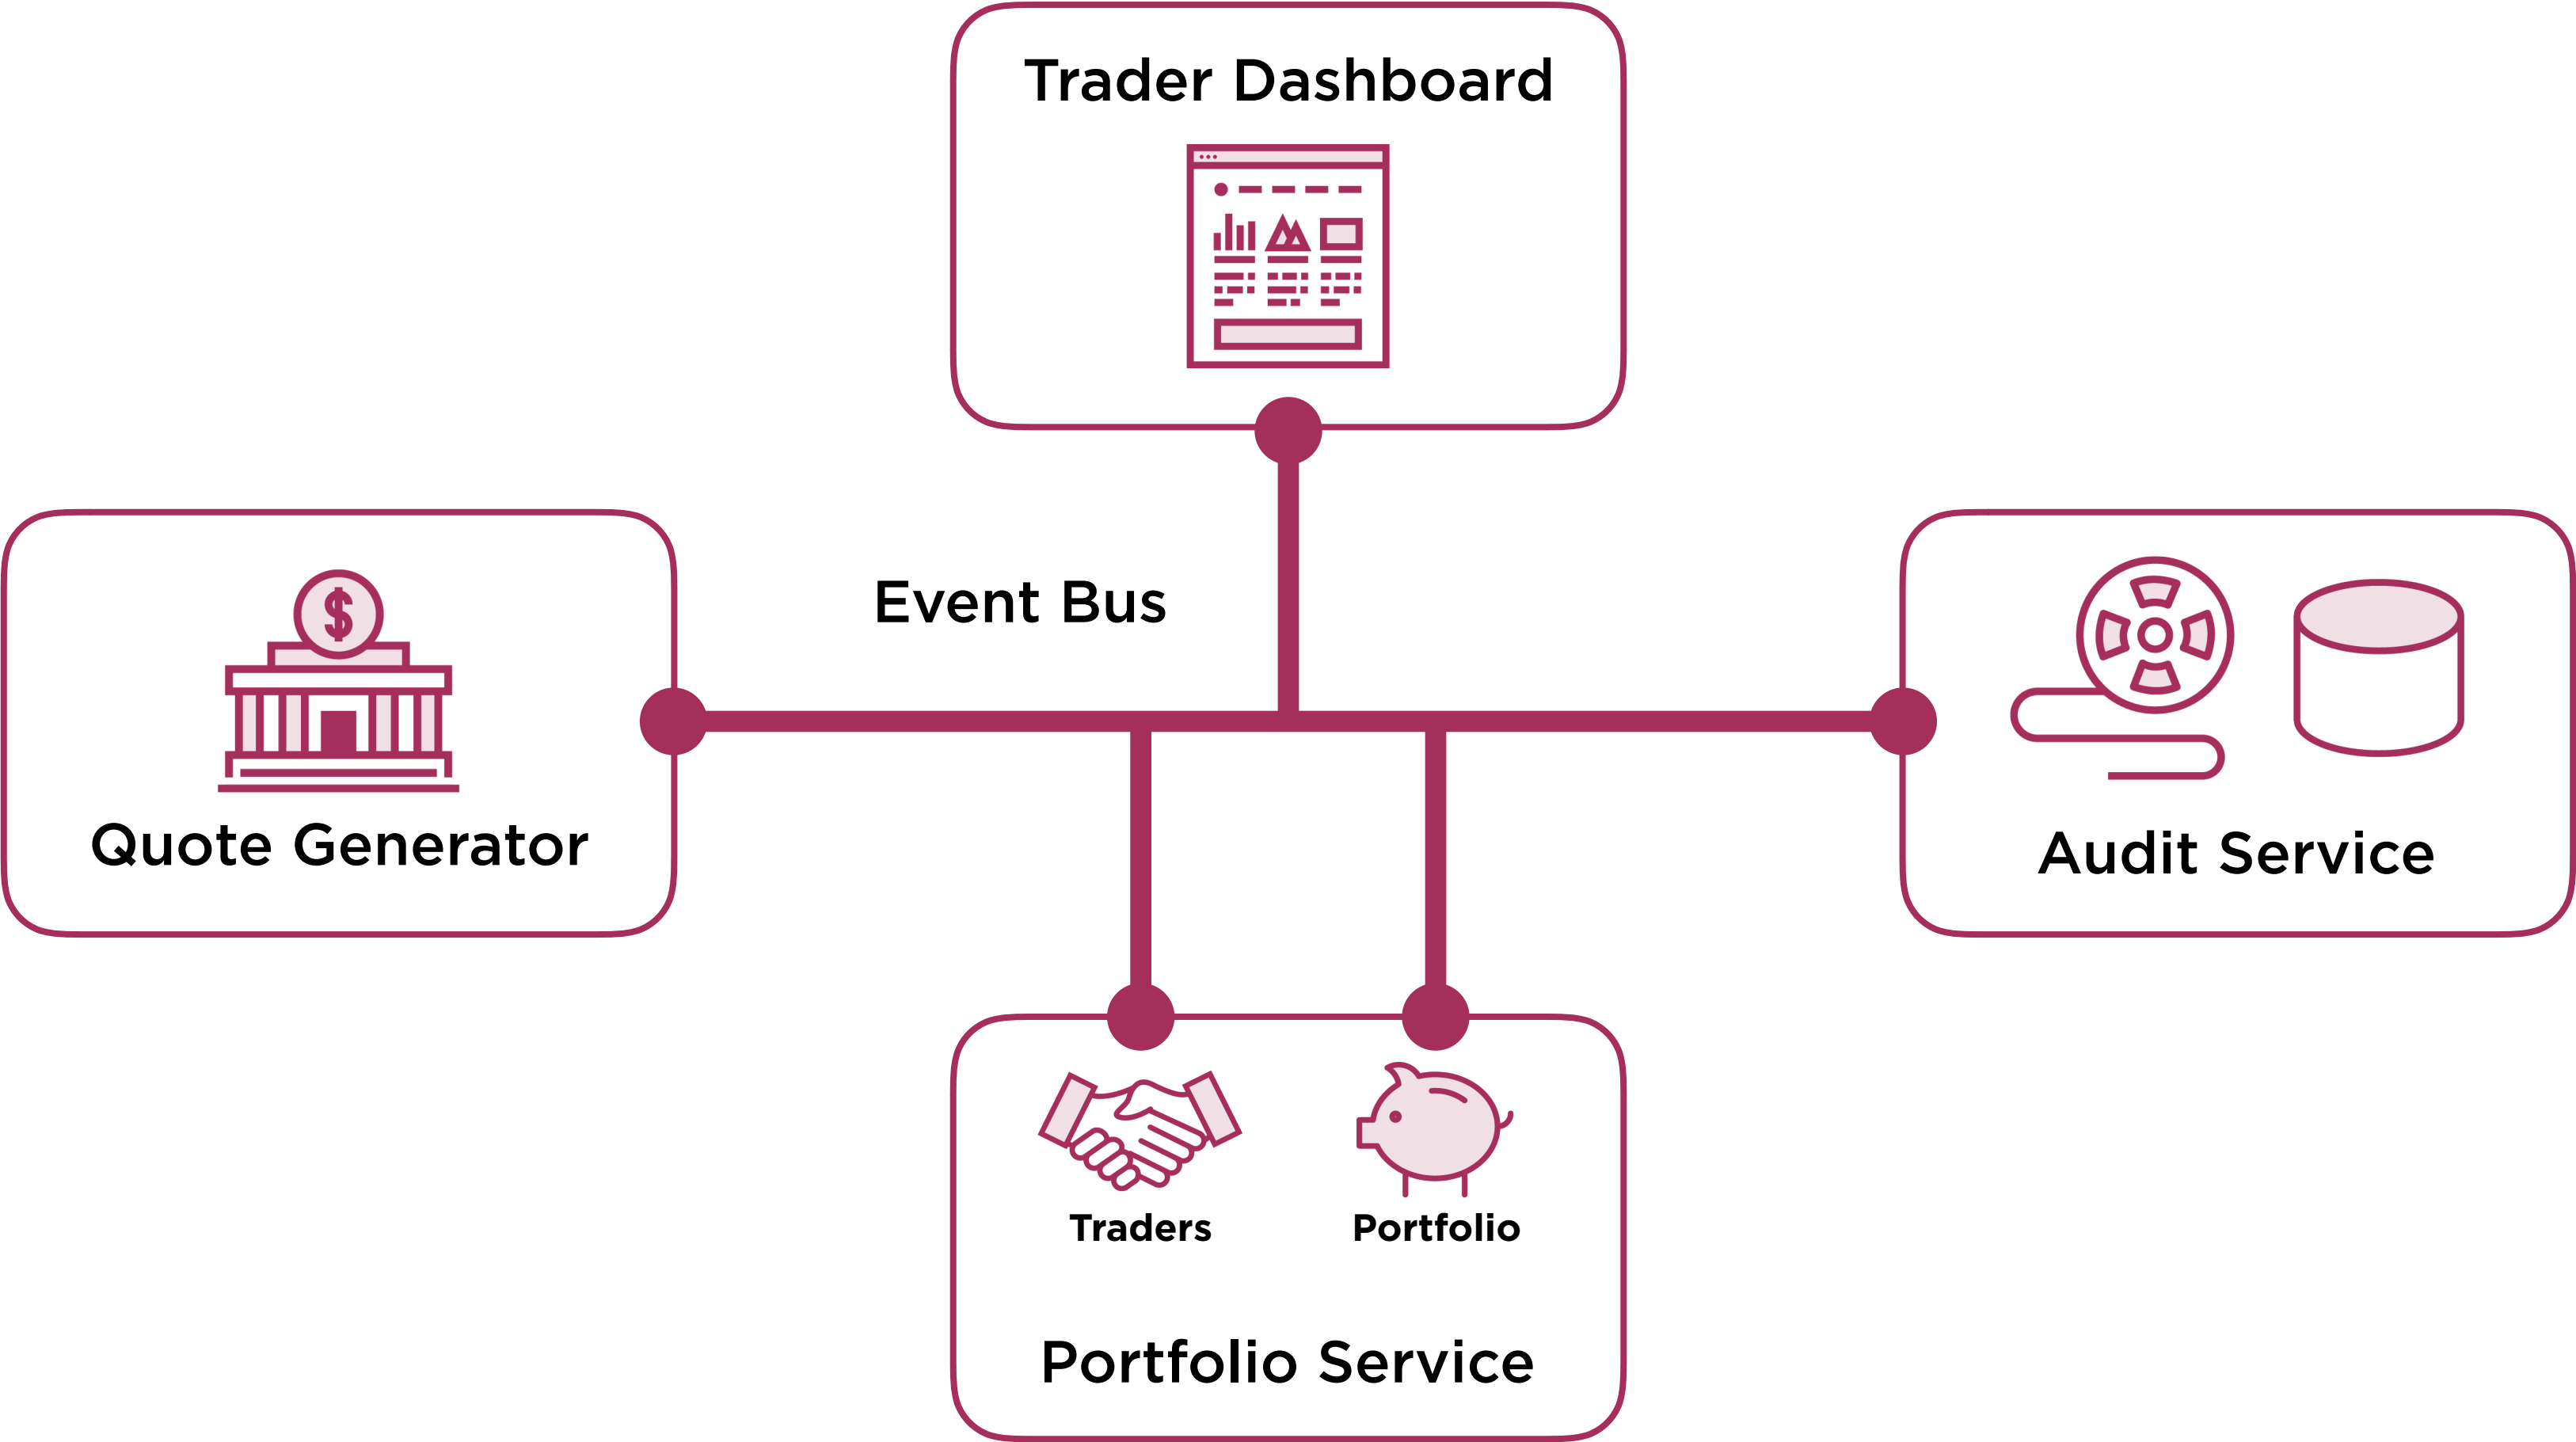

Self contained deployable artifact

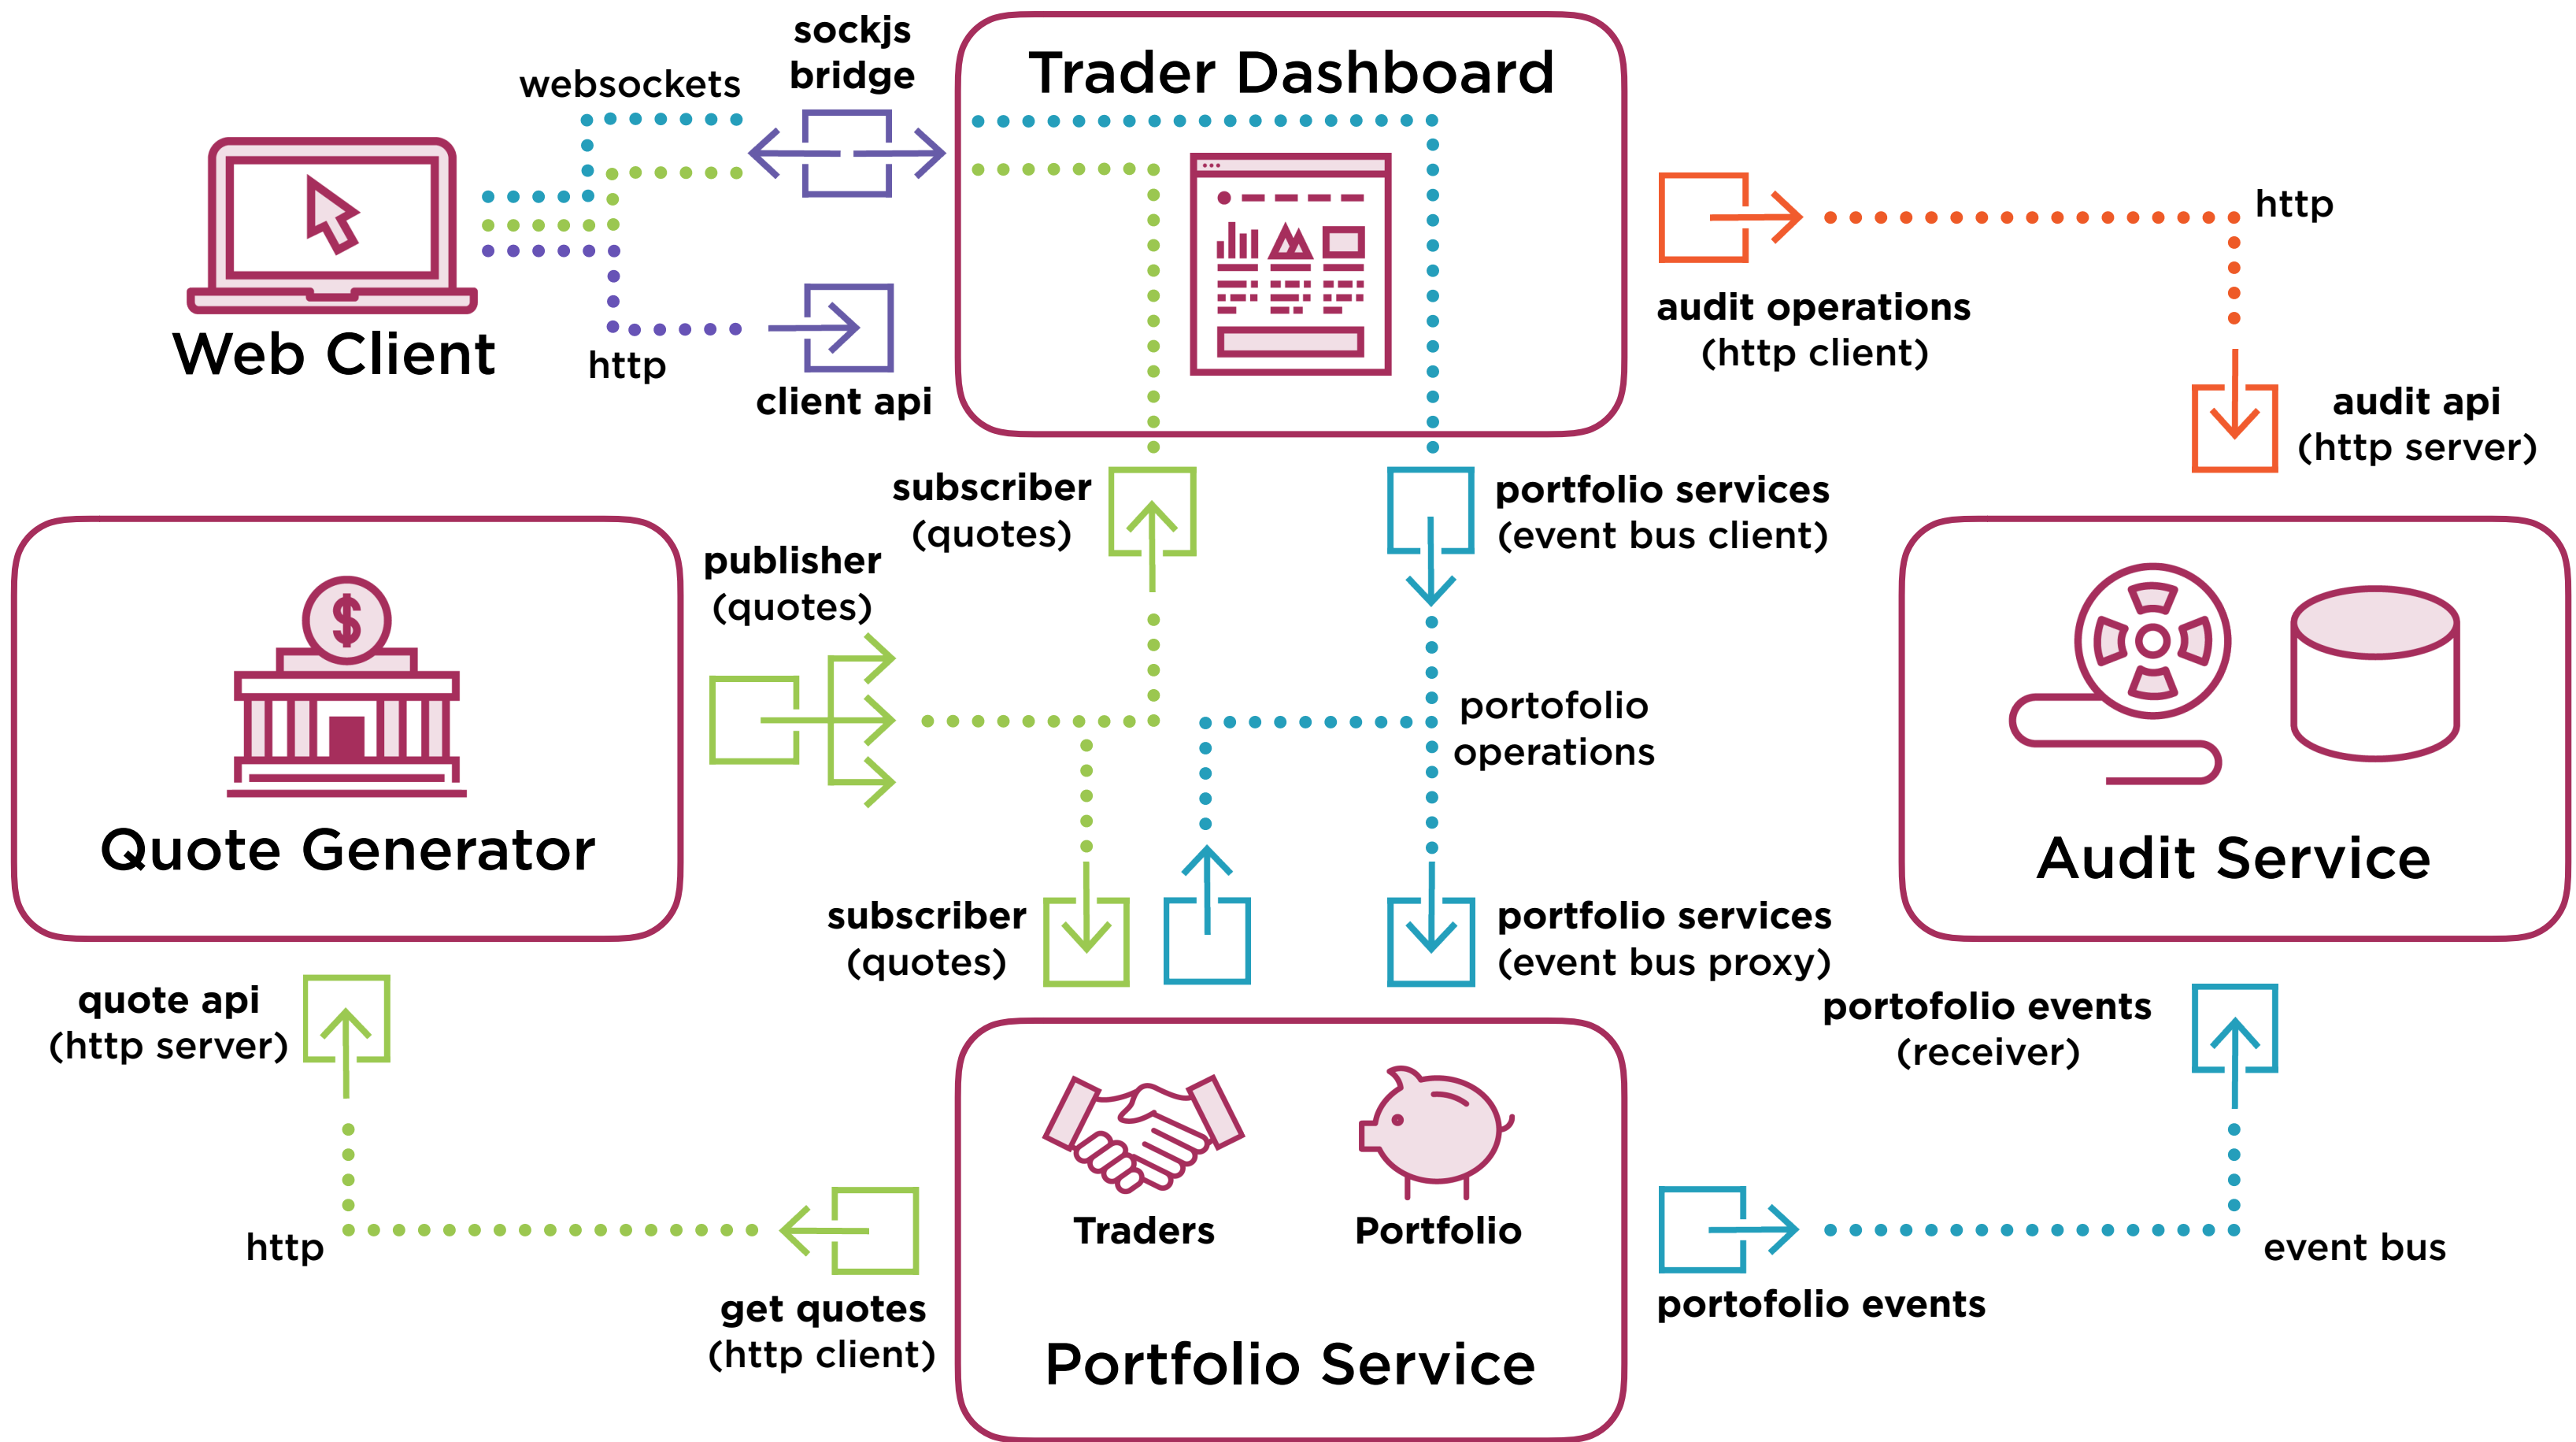

Single runnable artifact

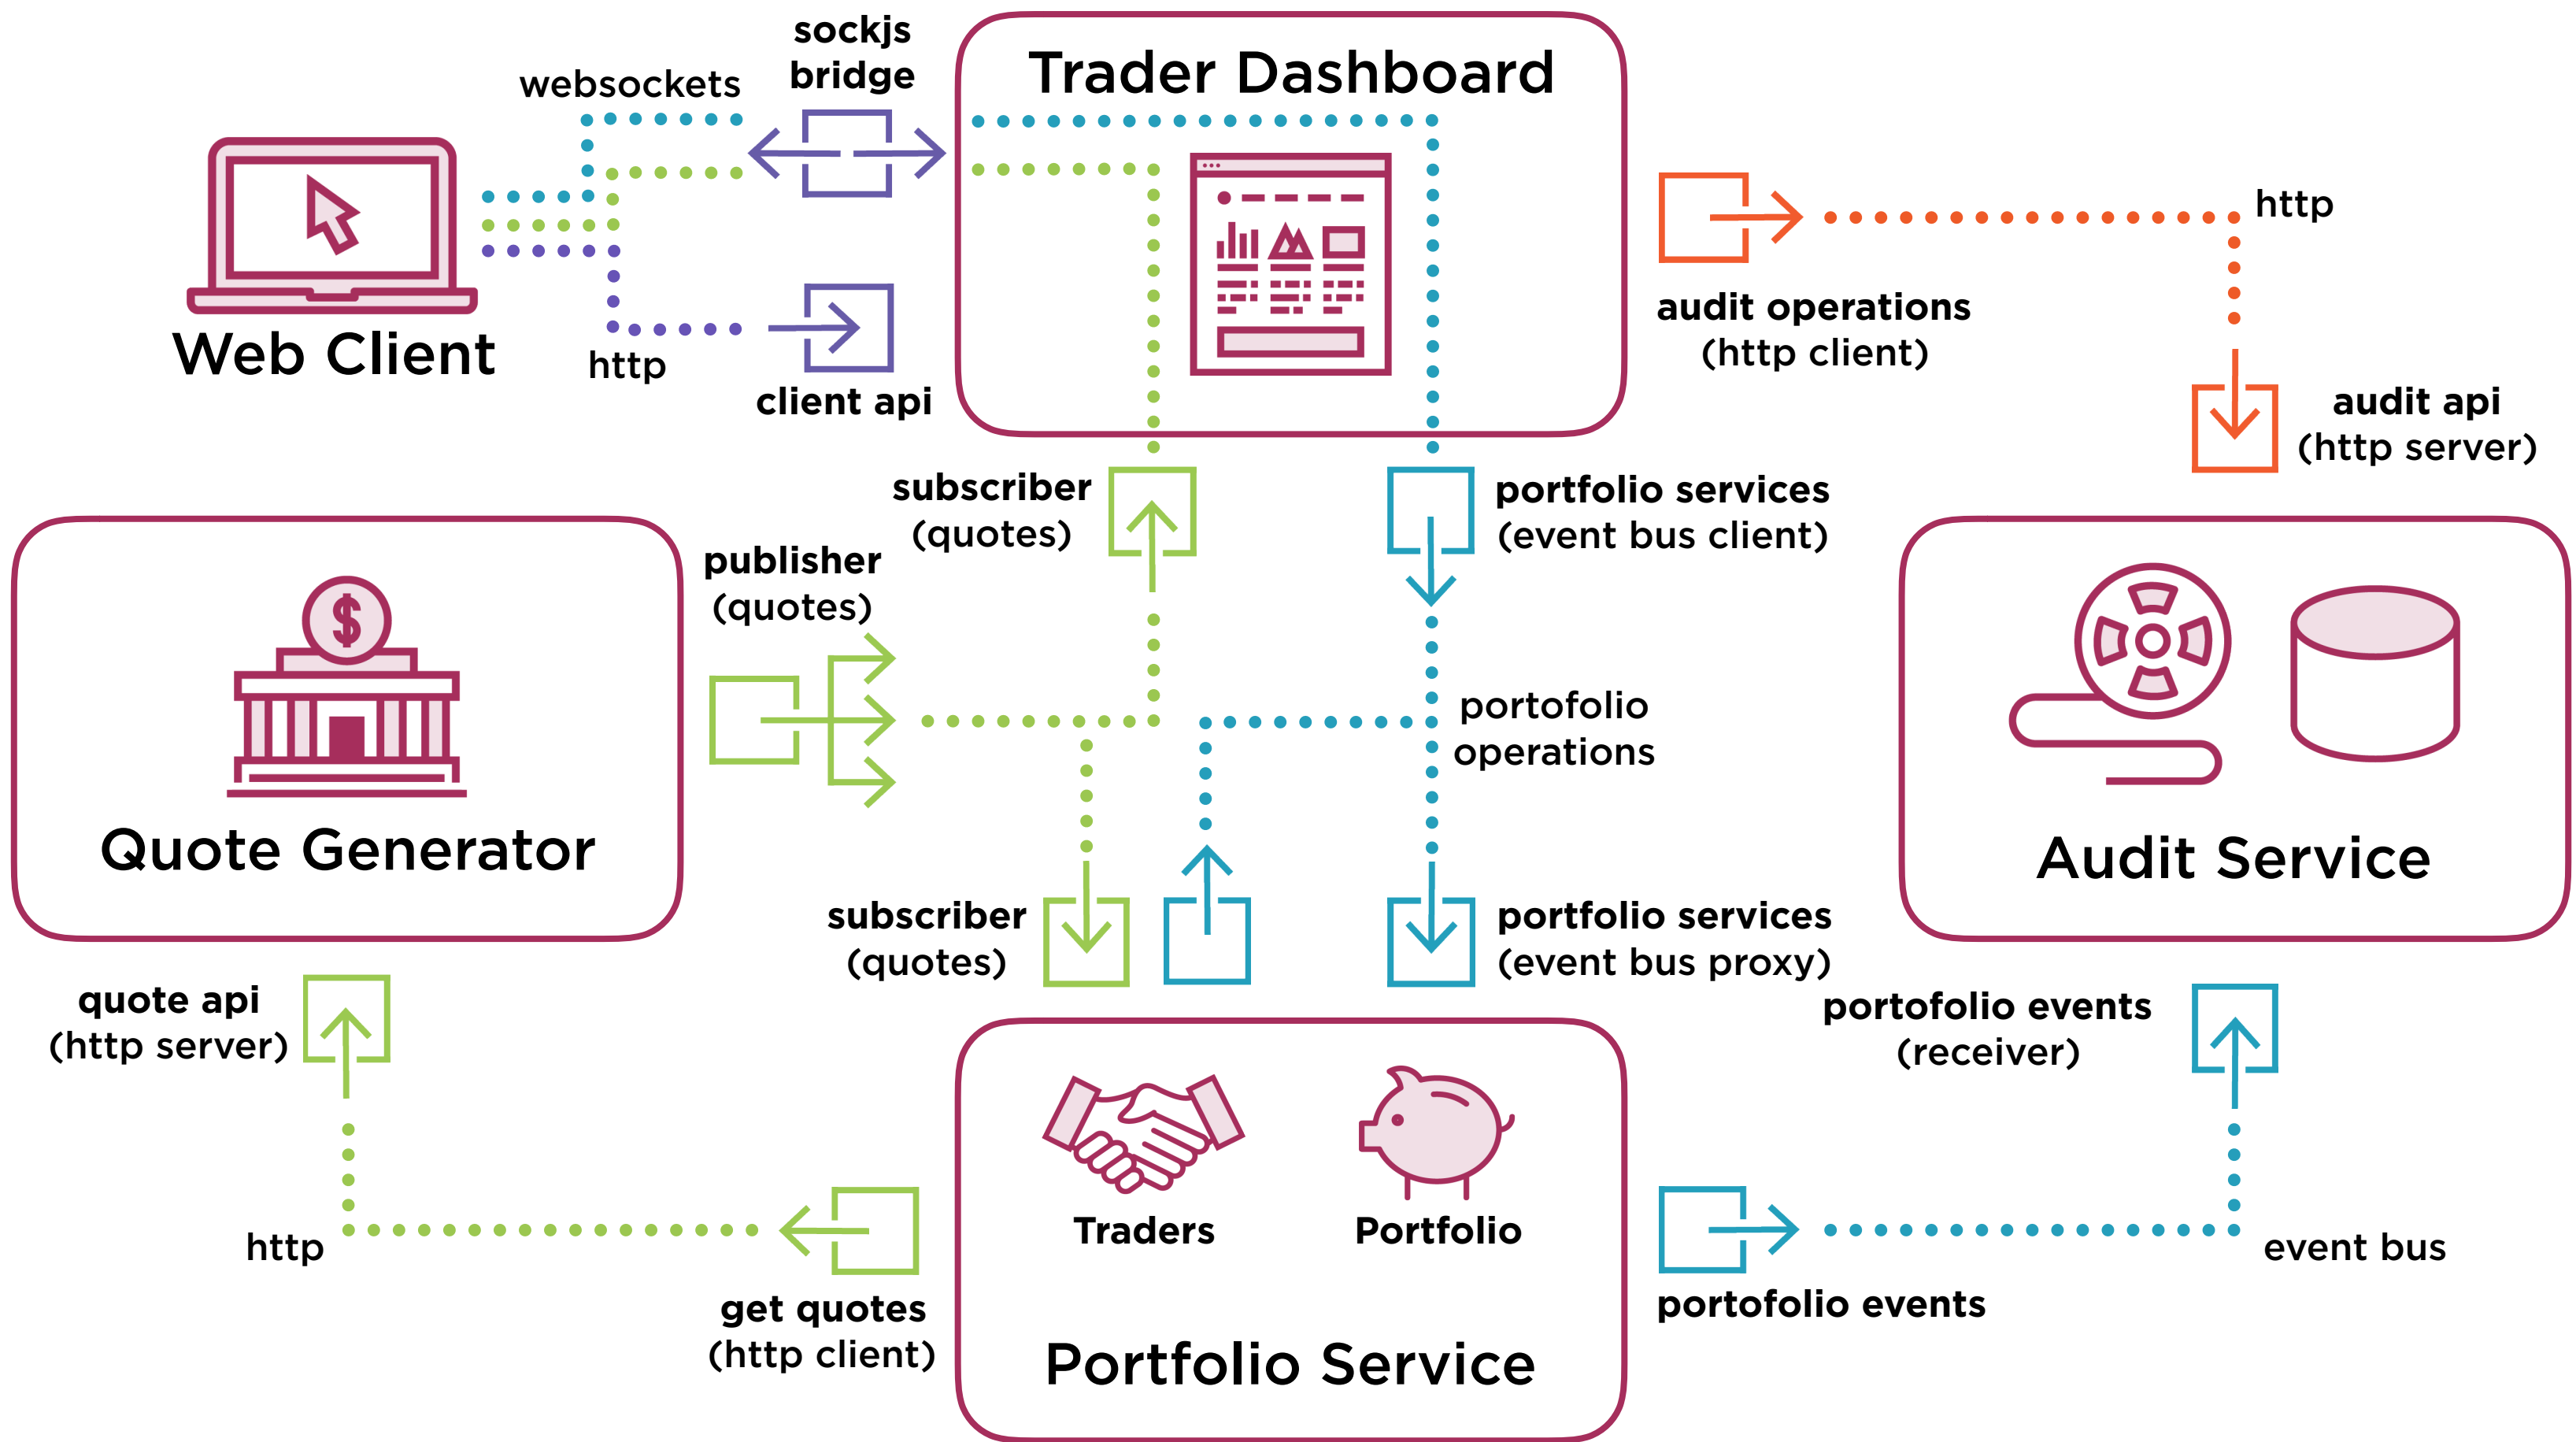

- e.g. `$ java -jar my-fat-jar.jar`

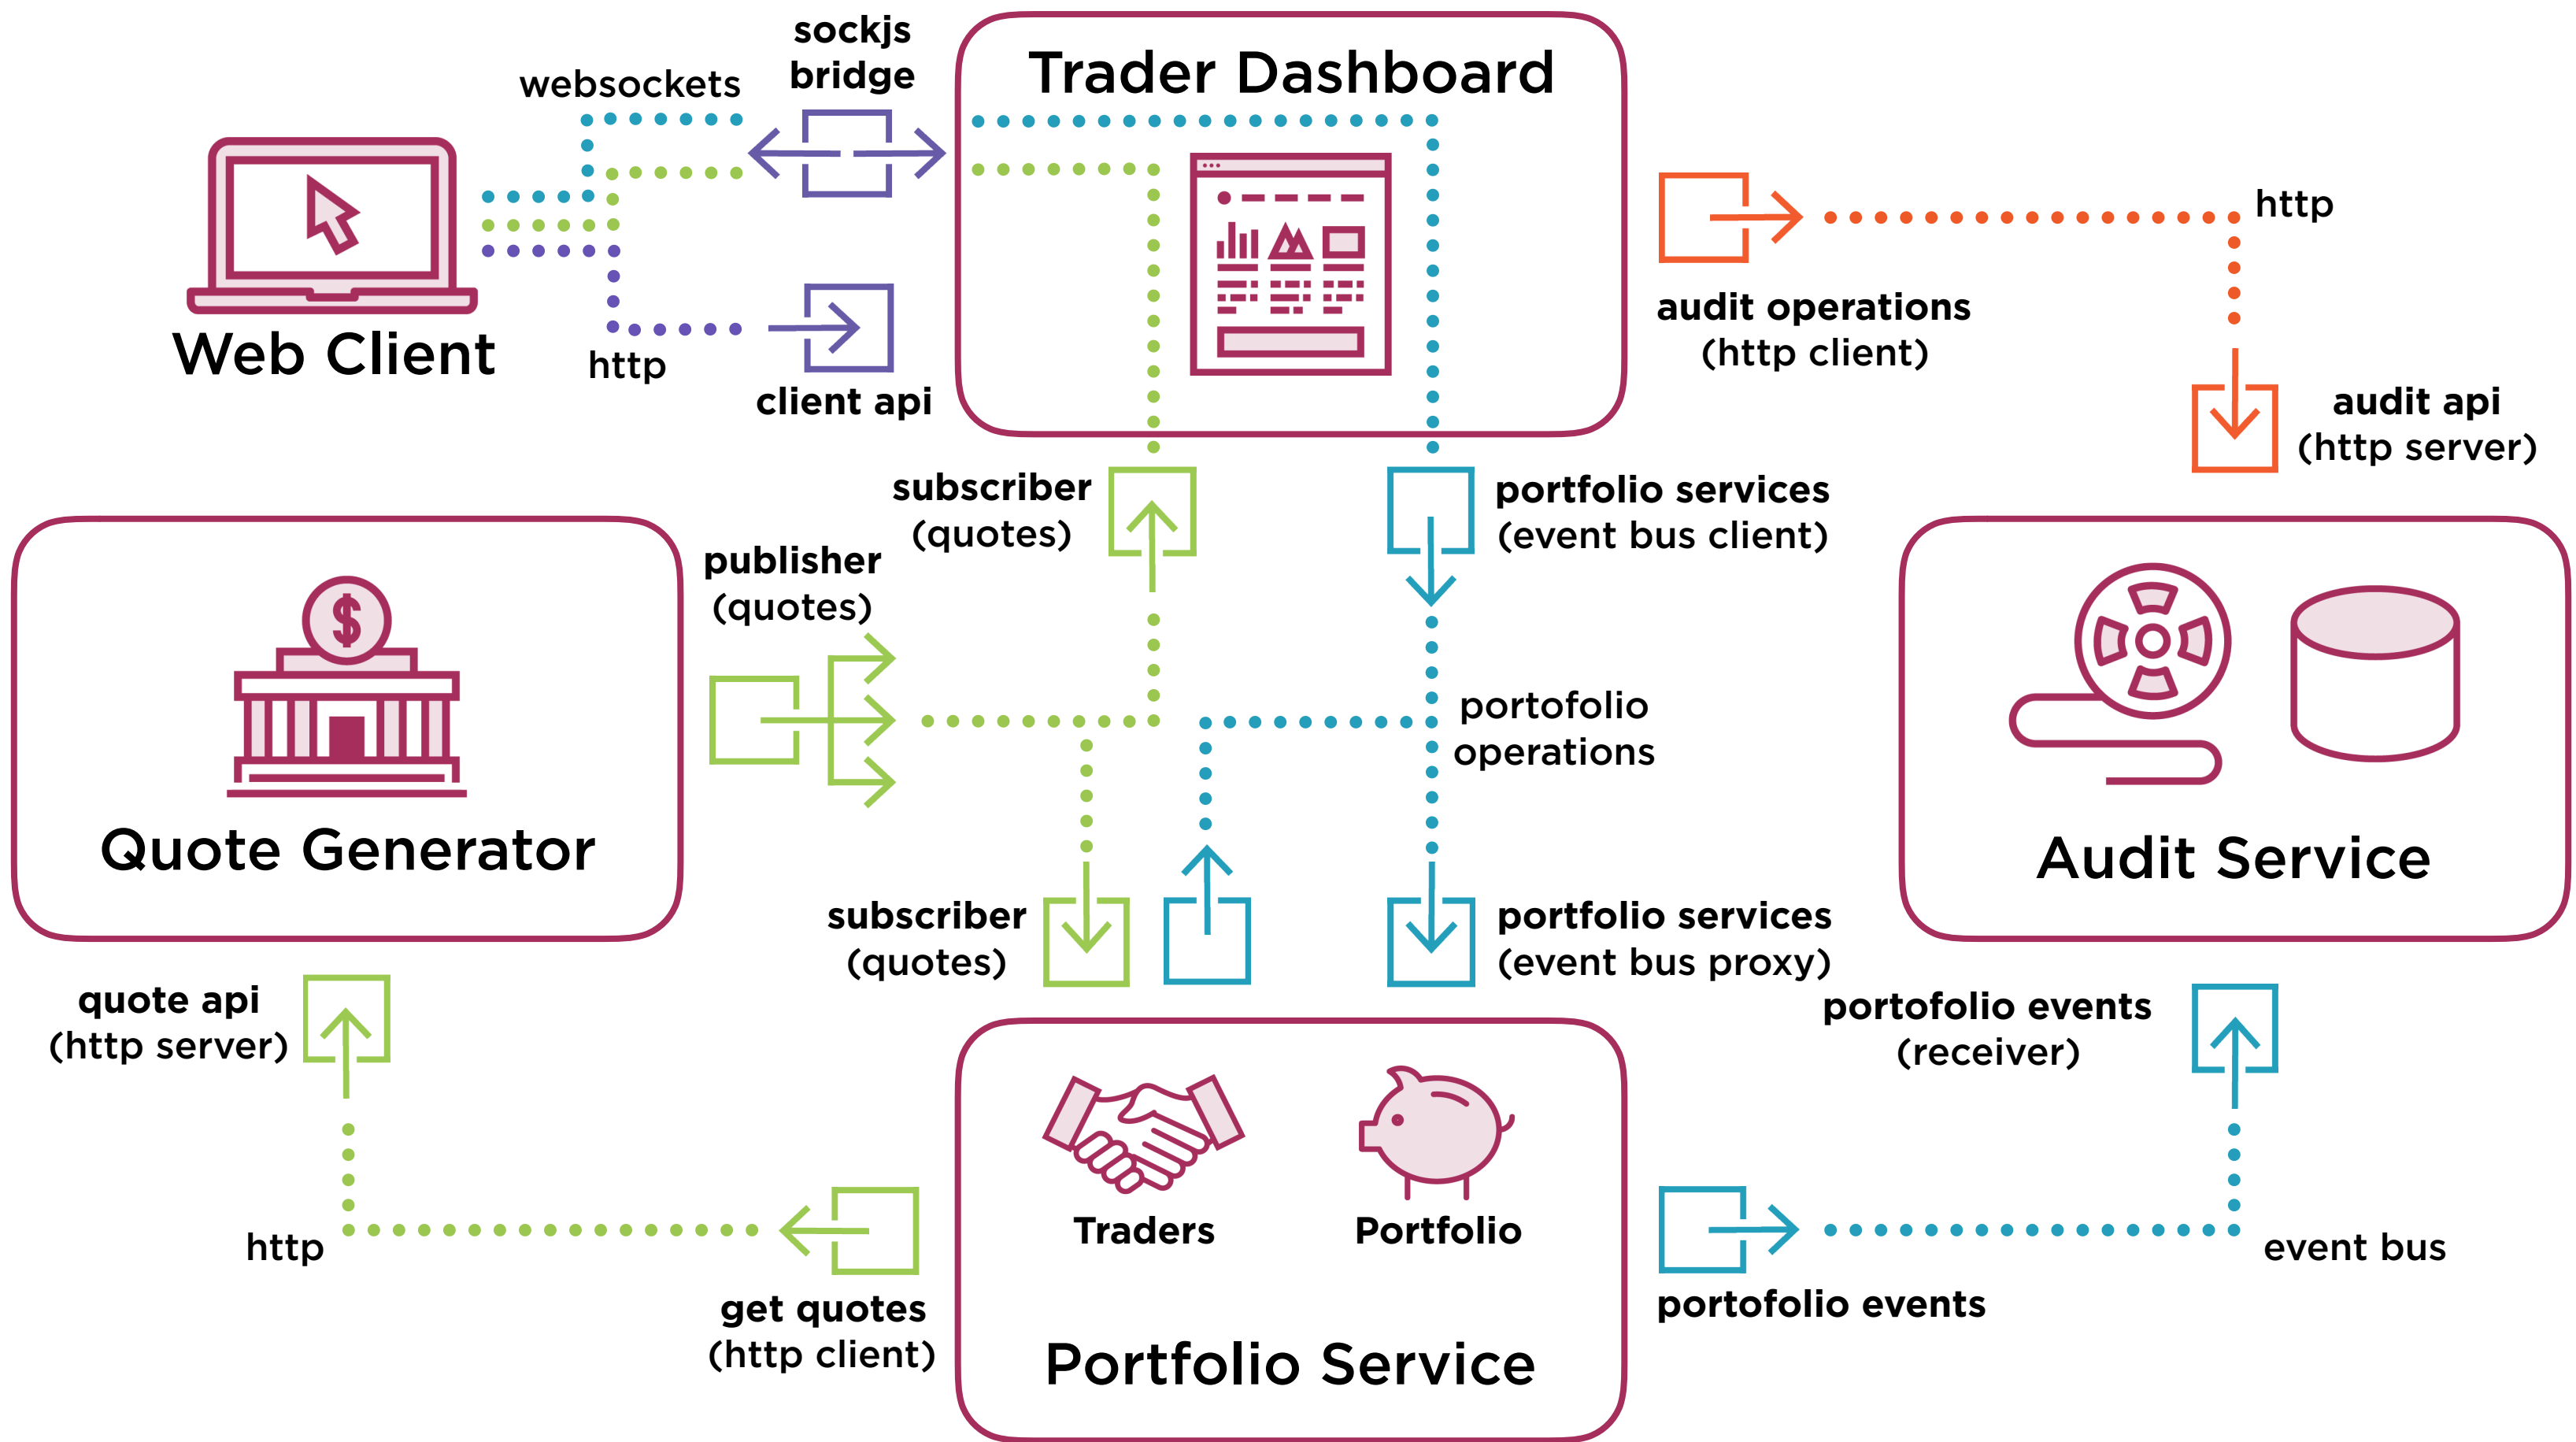

Running the Application

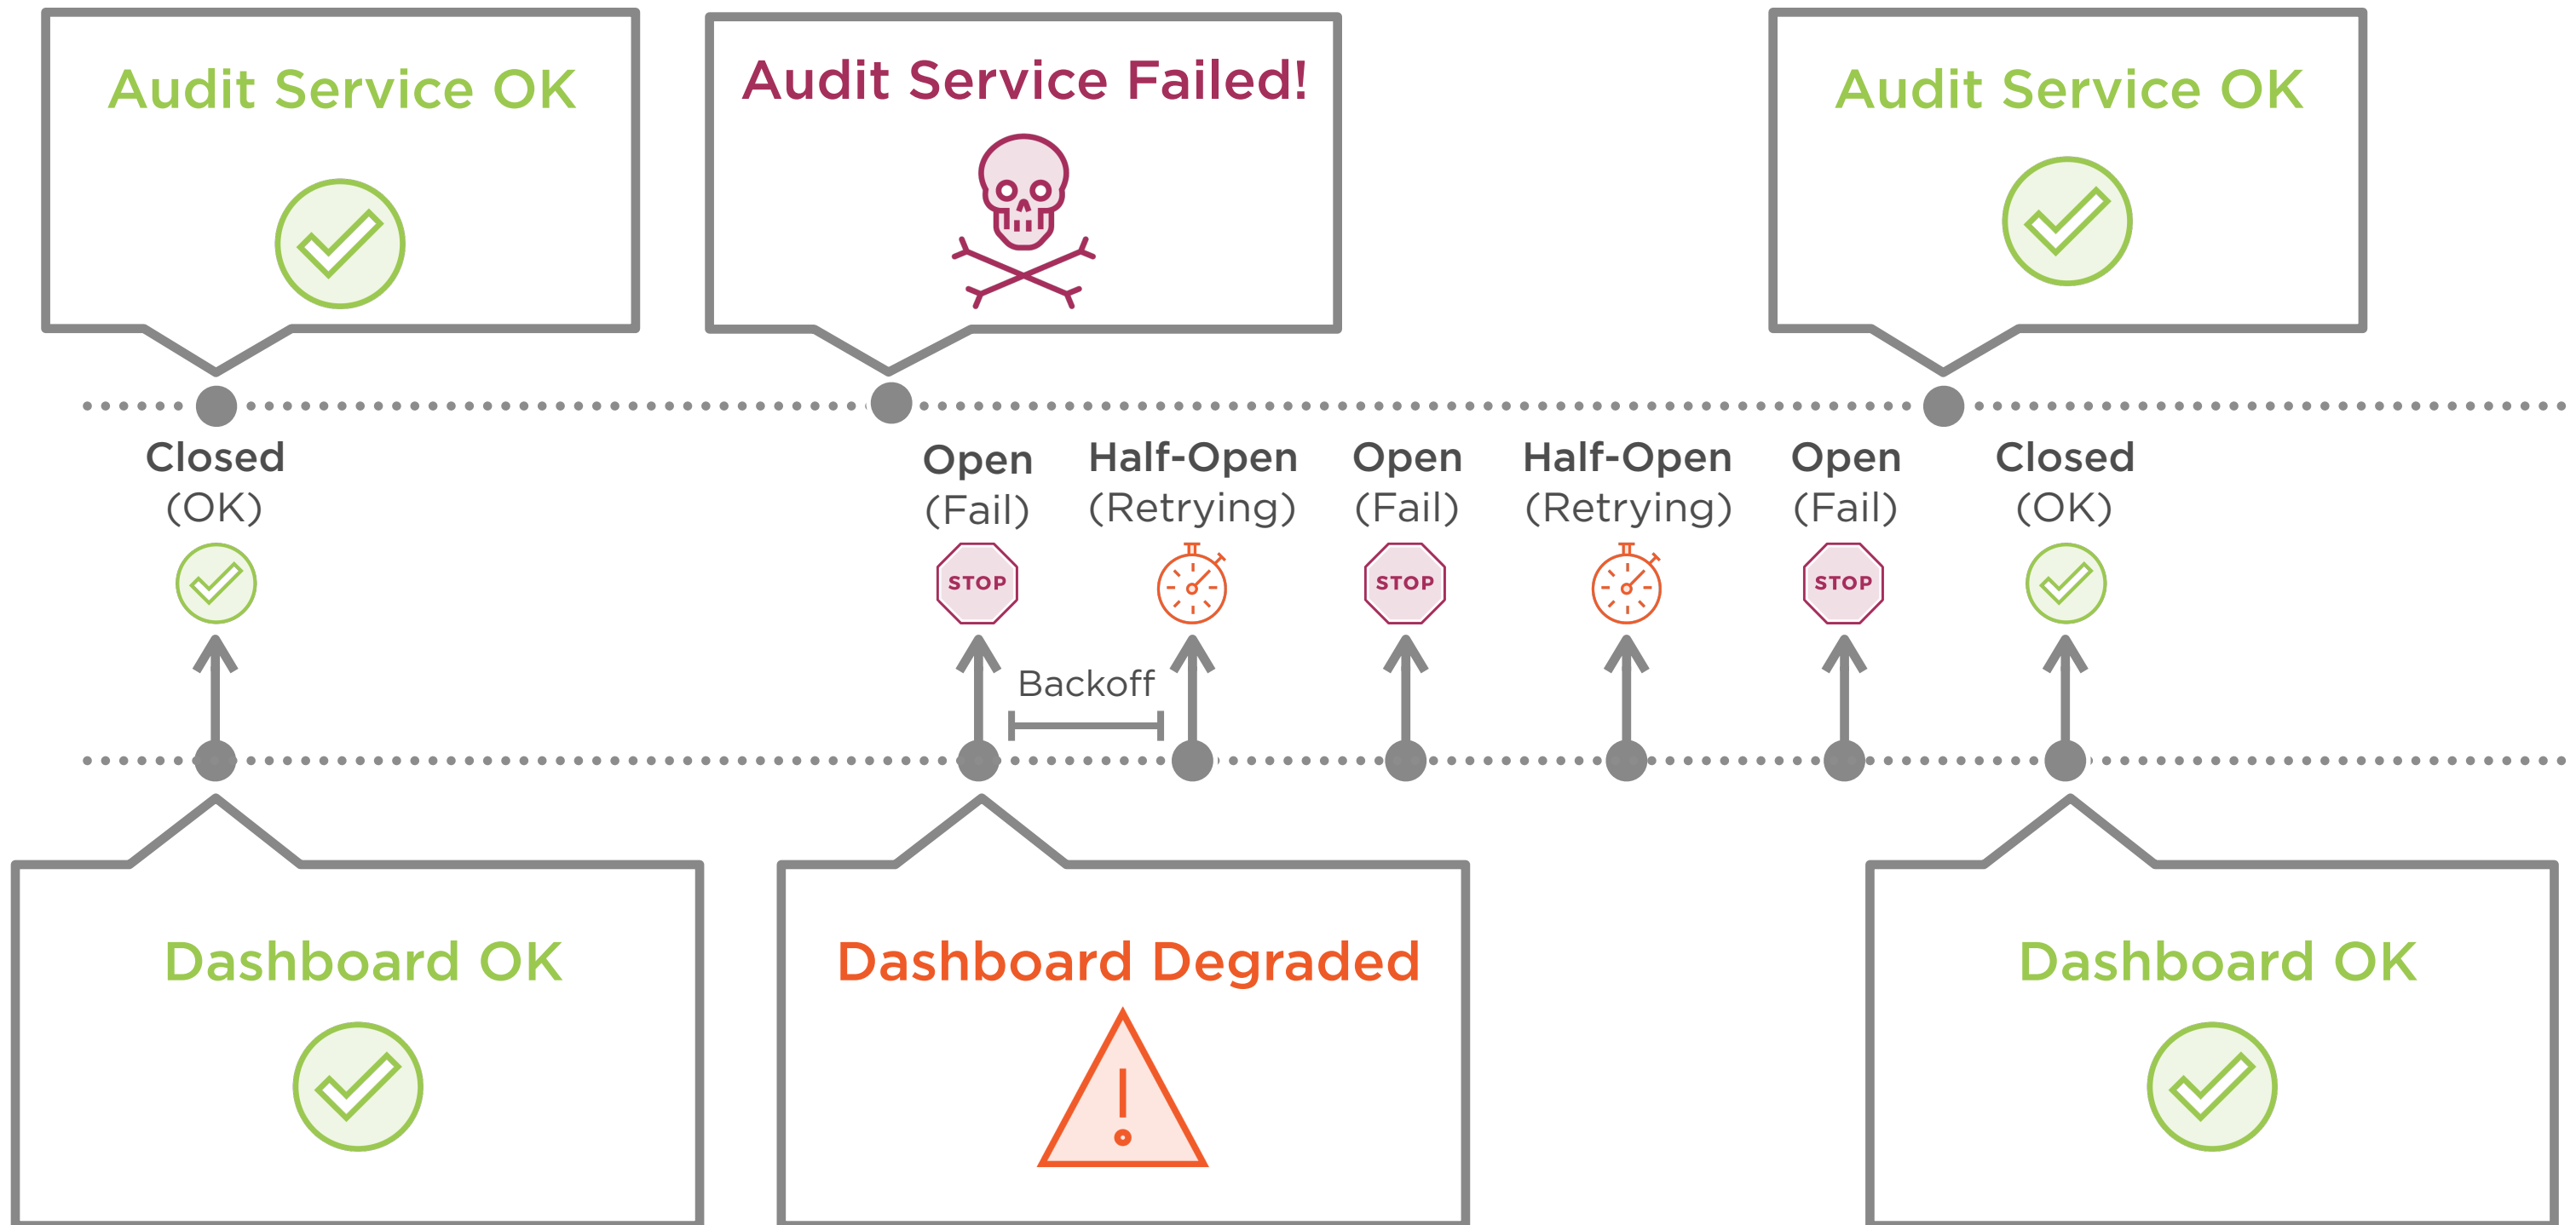

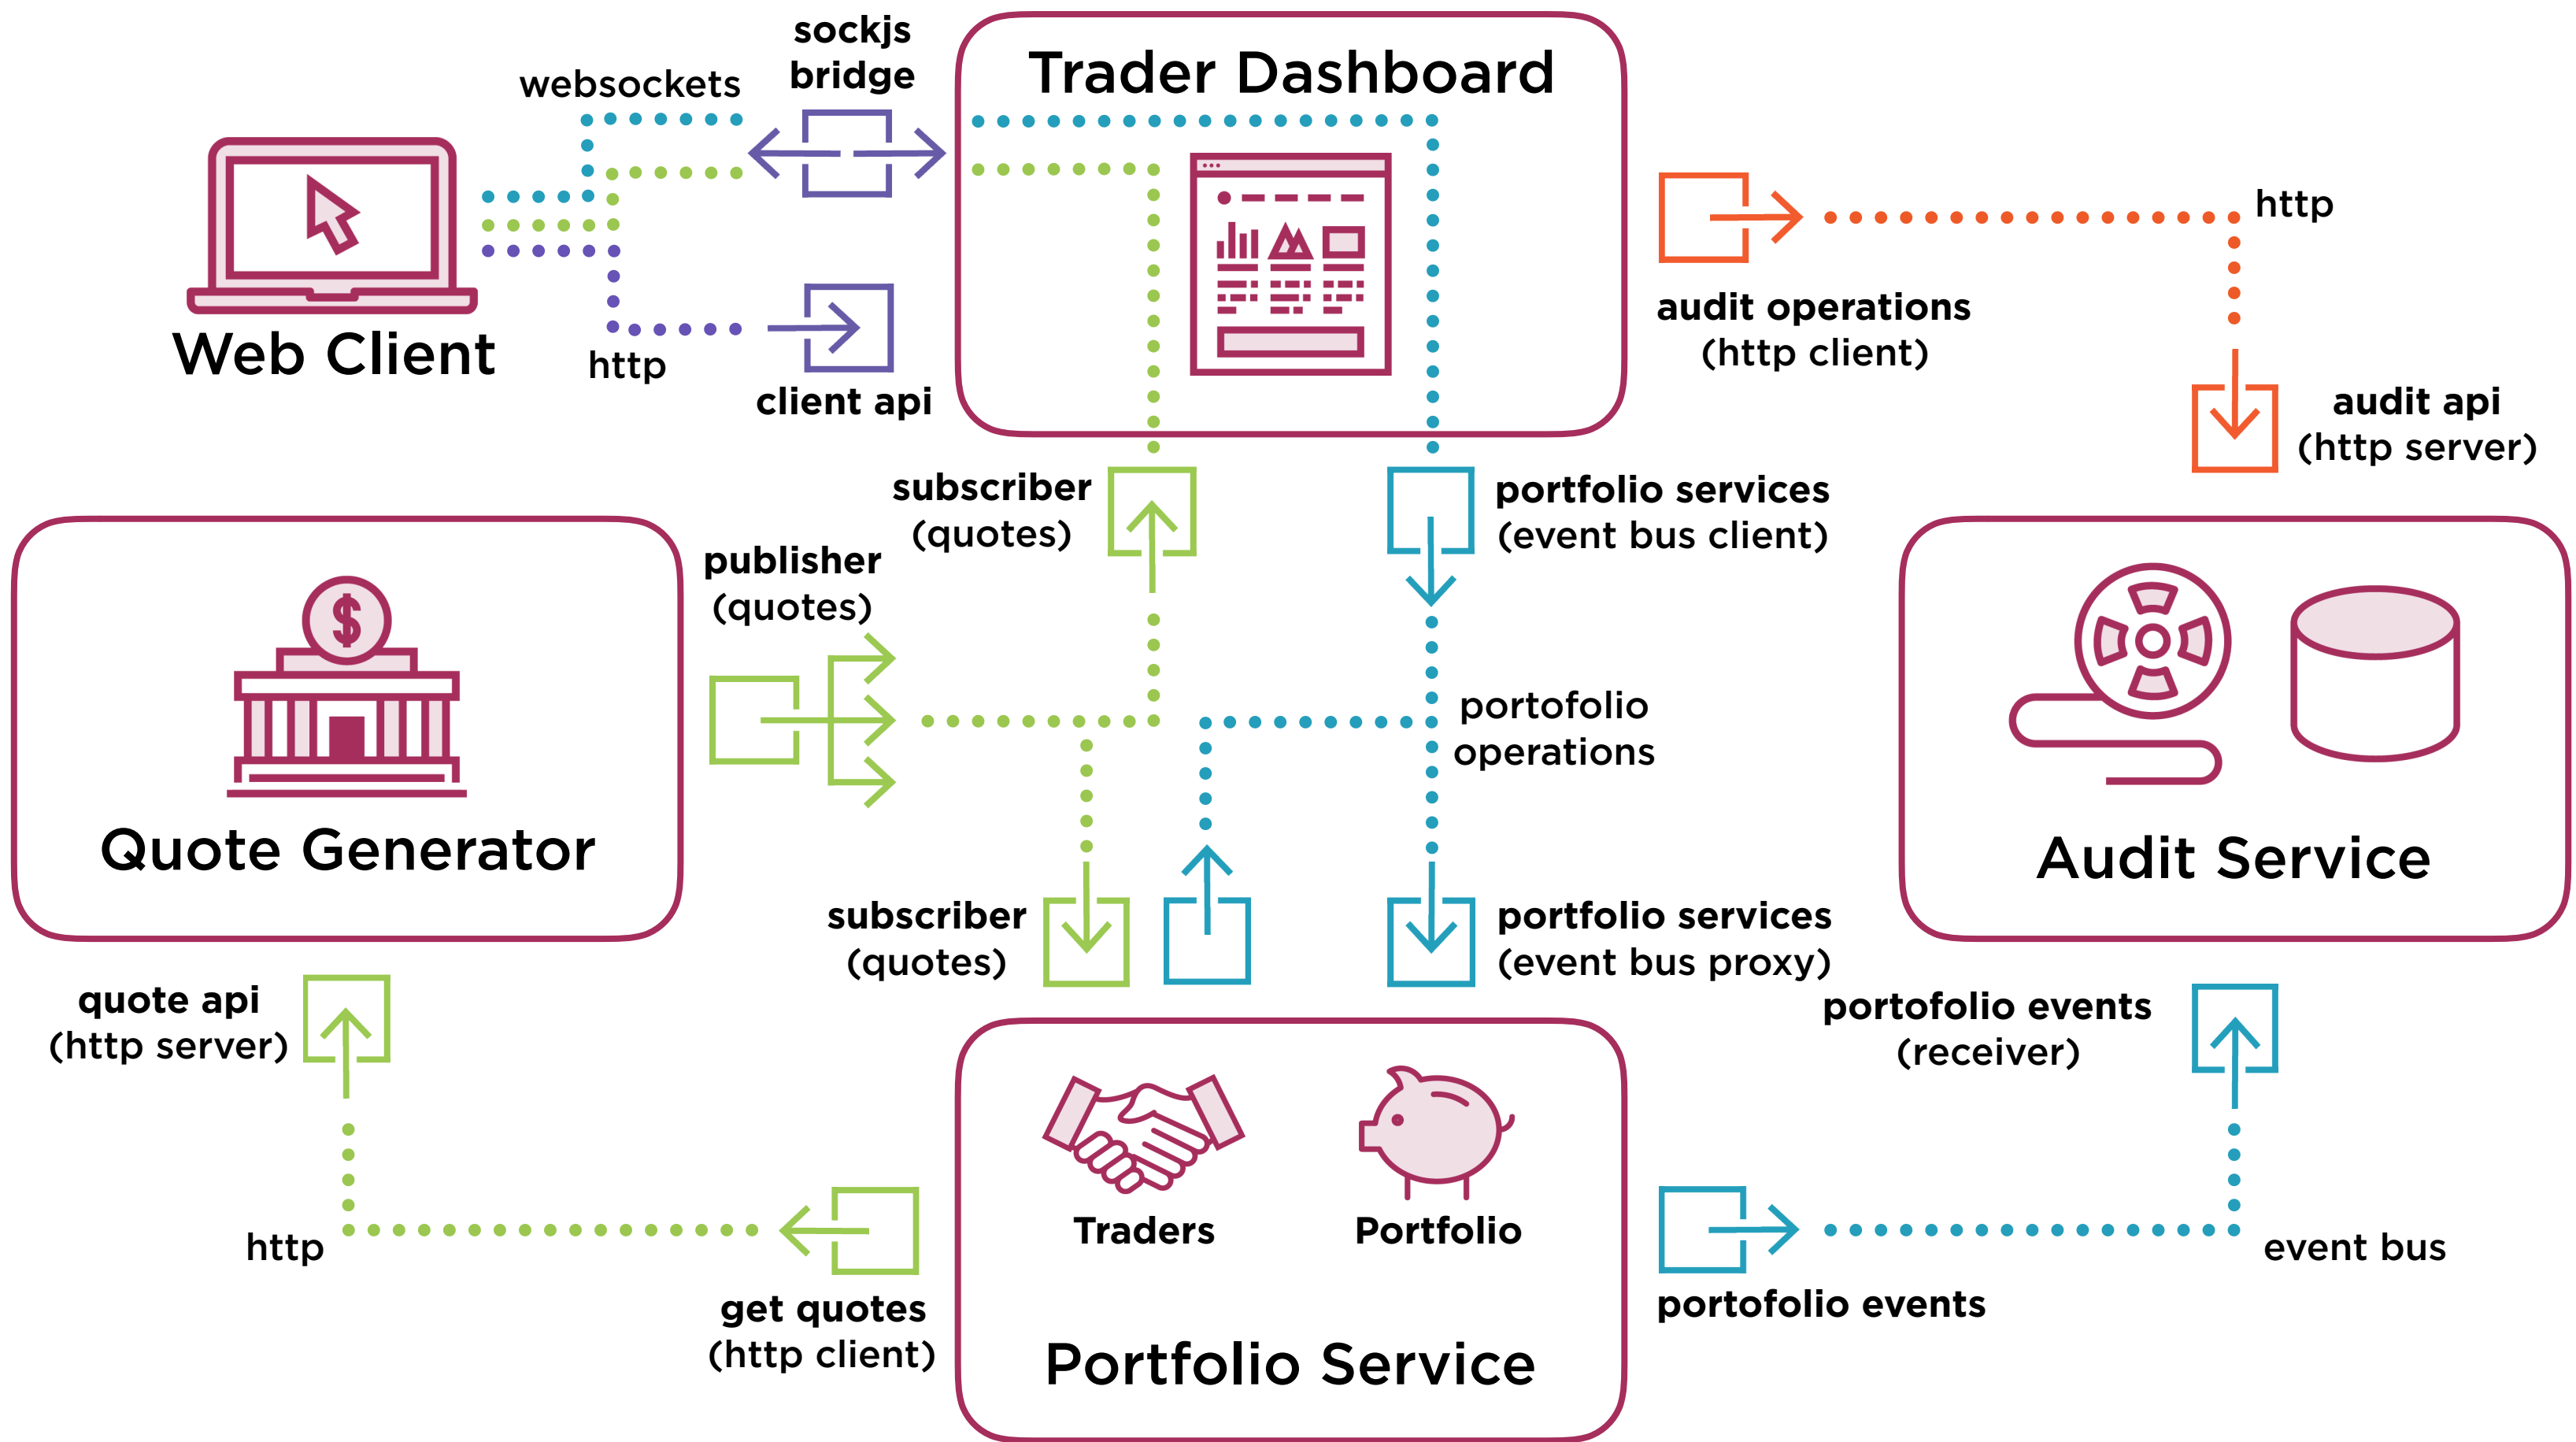

Audit Database Migrations

Circuit Breaker Pattern

Testing the Application

Summary

Creating the Sample Application

- Microservices architecture
- Gradle multi-project build
- Fat JARs for each application service
- Vert.x clustering for distributed communications
- Acceptance tests verify the application as a whole
